# Contextual Word Representations with BERT and Other Pre-trained Language Models

Jacob Devlin Google Al Language

# **History and Background**

# Pre-training in NLP

 Word embeddings are the basis of deep learning for NLP

 Word embeddings (word2vec, GloVe) are often pre-trained on text corpus from co-occurrence statistics

# Contextual Representations

 Problem: Word embeddings are applied in a context free manner

Solution: Train contextual representations on text corpus

```
[0.9, -0.2, 1.6, ...] [-1.9, -0.4, 0.1, ...] 

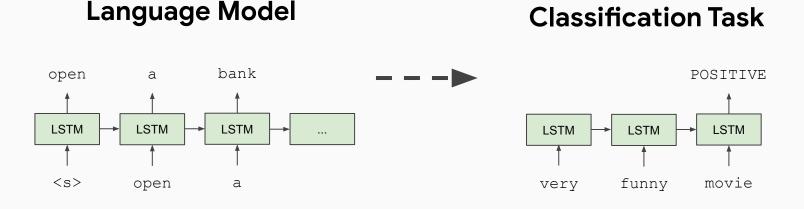

open a bank account on the river bank
```

# History of Contextual Representations

## **Model Architecture**

## Transformer encoder

- Multi-headed self attention
  - Models context
- Feed-forward layers
  - Computes non-linear hierarchical features
- Layer norm and residuals
  - Makes training deep networks healthy
- Positional embeddings
  - Allows model to learn relative positioning

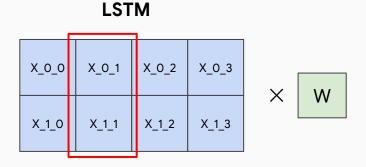

# **Model Architecture**

- Empirical advantages of Transformer vs. LSTM:
- 1. Self-attention == no locality bias
  - Long-distance context has "equal opportunity"
- 2. Single multiplication per layer == efficiency on TPU
  - Effective batch size is number of words, not sequences

# X\_0\_0 X\_0\_1 X\_0\_2 X\_0\_3 X\_1\_0 X\_1\_1 X\_1\_2 X\_1\_3

**Transformer** 

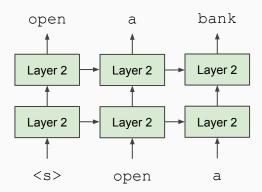

# **BERT**

## Problem with Previous Methods

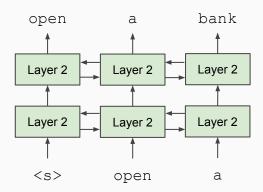

- Problem: Language models only use left context or right context, but language understanding is of a CONCATENATION OF BOTH bidirectional.
- Why are LMs unidirectional?
- Reason 1: Directionality is needed to generate a well-formed probability distribution.
  - We don't care about this.
- Reason 2: Words can "see themselves" in a bidirectional encoder.

## Unidirectional vs. Bidirectional Models

# Unidirectional context Build representation incrementally

# Bidirectional context Words can "see themselves"

## Masked LM

- Solution: Mask out k% of the input words, and then predict the masked words
  - We always use k = 15% We are only predicting 15 % of the words

```
store gallon

the man went to the [MASK] to buy a [MASK] of milk
```

- Too little masking: Too expensive to train will require a lot data
- Too much masking: Not enough context

## Masked LM

- Problem: Mask token never seen at fine-tuning
- Solution: 15% of the words to predict, but don't replace with [MASK] 100% of the time. Instead:
- 80% of the time, replace with [MASK]
   went to the store → went to the [MASK]
- 10% of the time, replace random word
   went to the store → went to the running
- 10% of the time, keep same
   went to the store → went to the store

## **Next Sentence Prediction**

 To learn relationships between sentences, predict whether Sentence B is actual sentence that proceeds Sentence A, or a random sentence

```
Sentence A = The man went to the store.
Sentence B = He bought a gallon of milk.
Label = IsNextSentence
```

```
Sentence A = The man went to the store.
Sentence B = Penguins are flightless.
Label = NotNextSentence
```

may not be that important

# Input Representation

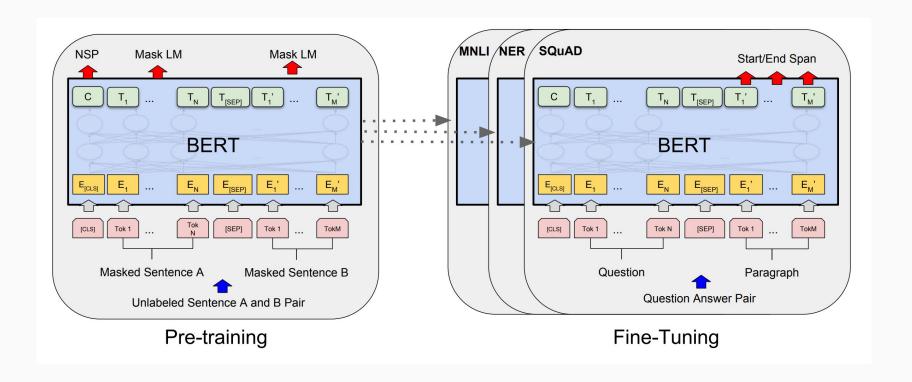

- Use 30,000 WordPiece vocabulary on input.
- Each token is sum of three embeddings
- Single sequence is much more efficient.

transformers do not have positions encodings unlike LSTM

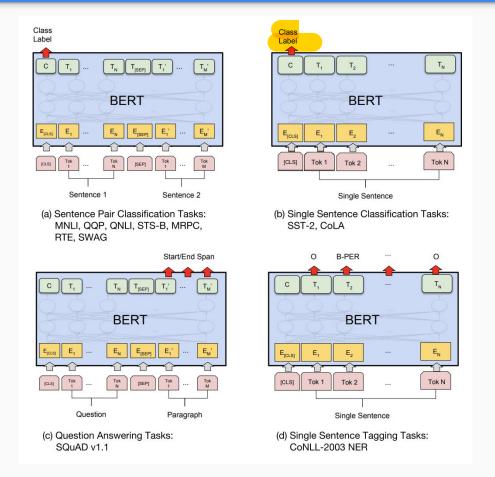

## **Model Details**

- <u>Data</u>: Wikipedia (2.5B words) + BookCorpus (800M words)
- <u>Batch Size</u>: 131,072 words (1024 sequences \* 128 length or 256 sequences \* 512 length)
- <u>Training Time</u>: 1M steps (~40 epochs)
- Optimizer: AdamW, 1e-4 learning rate, linear decay
- BERT-Base: 12-layer, 768-hidden, 12-head
- BERT-Large: 24-layer, 1024-hidden, 16-head
- Trained on 4x4 or 8x8 TPU slice for 4 days

#### MultiNLI

<u>Premise</u>: Hills and mountains are especially

sanctified in Jainism.

Hypothesis: Jainism hates nature.

<u>Label</u>: Contradiction

#### CoLa

<u>Sentence</u>: The wagon rumbled down the road.

Label: Acceptable

<u>Sentence</u>: The car honked down the road.

<u>Label</u>: Unacceptable

## SQuAD 2.0

#### What action did the US begin that started the second oil shock?

Ground Truth Answers: <No Answer>

Prediction: <No Answer>

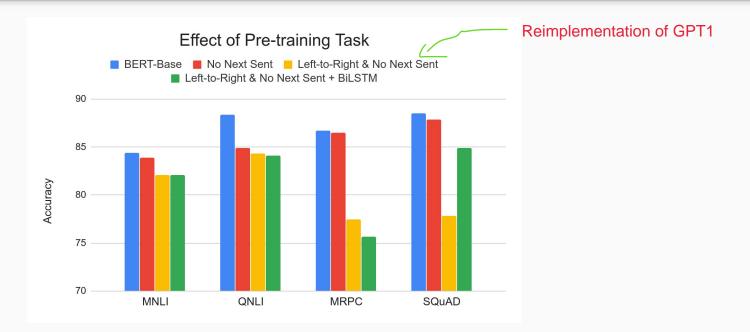

The 1973 oil crisis began in October 1973 when the members of the Organization of Arab Petroleum Exporting Countries (OAPEC, consisting of the Arab members of OPEC plus Egypt and Syria) proclaimed an oil embargo. By the end of the embargo in March 1974, the price of oil had risen from US\$3 per barrel to nearly \$12 globally; US prices were significantly higher. The embargo caused an oil crisis, or "shock", with many short- and long-term effects on global politics and the global economy. It was later called the "first oil shock", followed by the 1979 oil crisis, termed the "second oil shock."

•	Use token O ([CLS])	to emit
	logit for "no answer"	•

- "No answer" directly competes with answer span.
- Threshold is optimized on dev set.

20 Sep 13, 2018	nlnet (single model) Microsoft Research Asia	74.272	77.052

# Effect of Pre-training Task

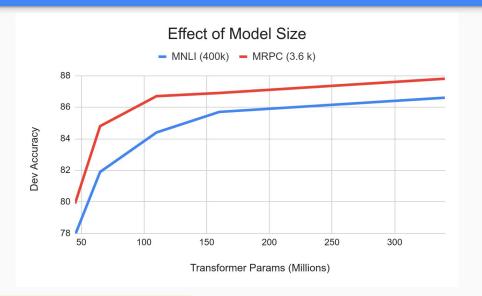

- Masked LM (compared to left-to-right LM) is very important on some tasks, Next Sentence Prediction is important on other tasks.
- Left-to-right model does very poorly on word-level task (SQuAD), although this is mitigated by BiLSTM

# Effect of Directionality and Training Time

- Masked LM takes slightly longer to converge because we only predict 15% instead of 100%
- But absolute results are much better almost immediately

## **Effect of Model Size**

- Big models help a lot
- Going from 110M -> 340M params helps even on datasets with 3,600 labeled examples
- Improvements have not asymptoted

# Open Source Release

- One reason for BERT's success was the open source release
  - Minimal release (not part of a larger codebase)
  - No dependencies but TensorFlow (or PyTorch)
  - Abstracted so people could including a single file to use model
  - End-to-end push-button examples to train SOTA models
  - Thorough README
  - Idiomatic code
  - Well-documented code
  - Good support (for the first few months)

# Post-BERT Pre-training Advancements

## Roberta

- RoBERTa: A Robustly Optimized BERT Pretraining Approach (Liu et al, University of Washington and Facebook, 2019)
- Trained BERT for more epochs and/or on more data
  - Showed that more epochs alone helps, even on same data
  - More data also helps
- Improved masking and pre-training data slightly

	MNLI	QNLI	QQP	RTE	SST	MRPC	CoLA	STS	WNLI	Avg
Single-task si	ngle models	on dev								
$BERT_{LARGE}$	86.6/-	92.3	91.3	70.4	93.2	88.0	60.6	90.0	_	-
XLNet <sub>LARGE</sub>	89.8/-	93.9	91.8	83.8	95.6	89.2	63.6	91.8	-	-
RoBERTa	90.2/90.2	94.7	92.2	86.6	96.4	90.9	68.0	92.4	91.3	-

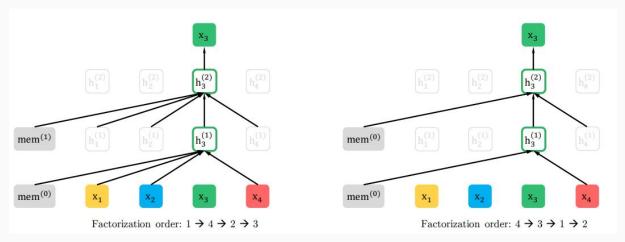

## XLNet

- XLNet: Generalized Autoregressive Pretraining for Language Understanding (Yang et al, CMU and Google, 2019)
- Innovation #1: Relative position embeddings
  - Sentence: John ate a hot dog
  - Absolute attention: "How much should dog attend to hot (in any position), and how much should dog in position 4 attend to the word in position 3? (Or 508 attend to 507, ...)"
  - Relative attention: "How much should dog attend to hot (in any position) and how much should dog attend to the previous word?"

## XLNet

## Innovation #2: Permutation Language Modeling

- In a left-to-right language model, every word is predicted based on all of the words to its left
- Instead: Randomly permute the order for every training sentence
- Equivalent to masking, but many more predictions per sentence
- Can be done efficiently with Transformers

## XLNet

 Also used more data and bigger models, but showed that innovations improved on BERT even with same data and model size

XLNet results:

Model	MNLI	QNLI	QQP	RTE	SST-2	MRPC	CoLA	STS-B
Single-task single	models on de	ev						
BERT [2]	86.6/-	92.3	91.3	70.4	93.2	88.0	60.6	90.0
RoBERTa [21]	90.2/90.2	94.7	92.2	86.6	96.4	90.9	68.0	92.4
XLNet	90.8/90.8	94.9	92.3	85.9	97.0	90.8	69.0	92.5

## **ALBERT**

- ALBERT: A Lite BERT for Self-supervised Learning of Language Representations (Lan et al, Google and TTI Chicago, 2019)
- Innovation #1: Factorized embedding parameterization
  - Use small embedding size (e.g., 128) and then project it to
     Transformer hidden size (e.g., 1024) with parameter matrix

## **ALBERT**

- Innovation #2: Cross-layer parameter sharing
  - Share all parameters between Transformer layers

you have less overfitting

Results:

## **T**5

- Exploring the Limits of Transfer Learning with a Unified Text-to-Text Transformer (Raffel et al, Google, 2019)
- Ablated many aspects of pre-training:
  - Model size
  - Amount of training data
  - Domain/cleanness of training data
  - Pre-training objective details (e.g., span length of masked text)
  - Ensembling
  - Finetuning recipe (e.g., only allowing certain layers to finetune)
  - Multi-task training

### Conclusions:

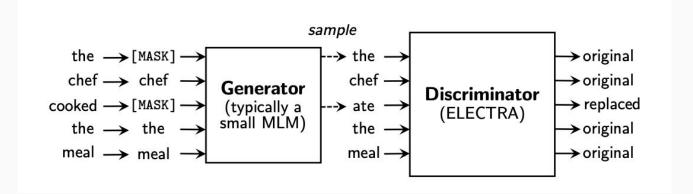

- Scaling up model size and amount of training data helps a lot
- Best model is 11B parameters (BERT-Large is 330M), trained on 120B words of cleaned common crawl text
- Exact masking/corruptions strategy doesn't matter that much
- Mostly negative results for better finetuning and multi-task strategies

# Applying Models to Production Services

- BERT and other pre-trained language models are extremely large and expensive
- How are companies applying them to low-latency production services?

Google is improving 10 percent of searches by understanding language context

Say hello to BERT

By Dieter Bohn | @backlon | Oct 25, 2019, 3:01am EDT

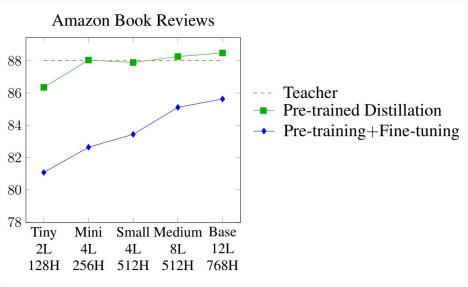

# Bing says it has been applying BERT since April

The natural language processing capabilities are now applied to all Bing queries globally.

George Nguyen on November 19, 2019 at 1:38 pm

- Answer: Distillation (a.k.a., model compression)
- Idea has been around for a long time:
  - Model Compression (Bucila et al, 2006)
  - Distilling the Knowledge in a Neural Network (Hinton et al, 2015)
- Simple technique:
  - Train "Teacher": Use SOTA pre-training + fine-tuning technique to train model with maximum accuracy
  - Label a large amount of unlabeled input examples with Teacher
  - Train "Student": Much smaller model (e.g., 50x smaller) which is trained to mimic Teacher output
  - Student objective is typically Mean Square Error or Cross Entropy

- Example distillation results
  - 50k labeled examples, 8M unlabeled examples

Well-Read Students Learn Better: On the Importance of Pre-training Compact Models (Turc et al, 2020)

 Distillation works much better than pre-training + fine-tuning with smaller model

## Why does distillation work so well? A hypothesis:

- Language modeling is the "ultimate" NLP task in many ways
  - I.e., a perfect language model is also a perfect question answering/entailment/sentiment analysis model
- Training a massive language model learns millions of latent features which are useful for these other NLP tasks
- Finetuning mostly just picks up and tweaks these existing latent features
- This requires an oversized model, because only a subset of the features are useful for any given task
- Distillation allows the model to only focus on those features
- Supporting evidence: Simple self-distillation (distilling a smaller BERT model) doesn't work

# **Conclusions**

## Conclusions

- Pre-trained bidirectional language models work incredibly well
- However, the models are extremely expensive
- Improvements (unfortunately) seem to mostly come from even more expensive models and more data
- The inference/serving problem is mostly "solved" through distillation
